

(a) Choose an interaction mechanism

- Choose a intercellular interaction
- Choose an inhibitory (\dashv) or excitatory (\rightarrow) effect of the interaction
- Choose an amplification factor

Intercellular region: $s_{cc} = 1/4 \int ds$

(b) Perform stochastic simulations

(e)

	Single cell	Doublet
Spontaneous	92%	24.5%
Ext. stimulus	97%	27.5%

(c) Identify polarity axis of each cell

(d) Classify outcomes based on orientation of polarity axes

$$\text{Outcome probability} = \frac{\text{number of outcomes}}{\text{number of realizations}}$$
